Subject:

sequence search for 10/788,779

Please search SEQ ID NO: 1-10 (these sequences are primers of 24 to 30 nucleotides) and limit the length of the search hits to 50 nucleotides.

Please provide a printout of the first 40 results.

The CRF has been entered http://expoweb1:8001/cgi-bin/expo/BioInfo/bioquery.pl?APPL_ID=10788779

Thank you-

Carla Myers AU 1634 Remsen Bldg / Rm 2E79 Mailbox: REM 2C70 571-272-0747

STIC SEARCH RESULTS FEEDBACK FORM

Biotech-Chem Library

Questions about the scope or the results of the search? Contact the searcher or contact:

Mary Hale, Information Branch Supervisor Remsen Bldg. 01 D86 571-272-2507

Vol	untary Results Feedback Form												
>	I am an examiner in Workgroup: Example: 1610												
· >	Relevant prior art found, search results used as follows:												
	☐ 102 rejection												
	☐ 103 rejection												
	Cited as being of interest.												
	Helped examiner better understand the invention.												
	Helped examiner better understand the state of the art in their technology.												
	Types of relevant prior art found:												
	☐ Foreign Patent(s)												
	Non-Patent Literature (journal articles, conference proceedings, new product announcements etc.)												
>	Relevant prior art not found:												
	Results verified the lack of relevant prior art (helped determine patentability).												
	Results were not useful in determining patentability or understanding the invention.												
Con	nments:

AAQ91121-Q91130 are nested PCR primers used for the amplification and identification of beta-cardiac myosin heavy-chain RNA. They are used in a new non-invasive method for diagnosing hyperrophic cardiomyopathy (HC), the method involves detecting the presence or absence of specific HC associated mutations in the beta-cardiac myosin heavy-chain obtained from a blood sample. The method may be used to diagnose familial or sporadic HC and the non-invasive method is particularly important when testing

Non-invasive method for diagnosis of hypertrophic cardio-myopathy useful for testing asymptomatic individual(s).

The invention relates to detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy (sporadic or familial, SHC and FHC) comprises detecting a mutation associated with hypertrophic cardiomyopathy in an amplified product of a beta cardiac myosin heavy chain DNA. The mutations associated with SHC/FHC are detected in the myosin gene isolated from blood, by detecting mis-matched areas in RNA-DNA hybrid double strands (RNA from the normal gene, DNA from the suspect determine life expectancy in affected individuals e.g. using a Kaplan-Moier curve for the classified type of FHC causing point mutation. Also included are an RNA probe comprising ribonucleotides arranged in a sequence which is complementary to at least a portion of beta-cardiac myosin heavy-chain DNA and a set of DNA oligonucleotide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two

```
oligonucleotides capable of amplifying beta-cardiac myosin heavy-chain DNA. The method is useful for detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy. This method is especially useful for diagnosing SHC and FHC, as well as for determining the estimated the life expectancy of a person with familial hypertrophic cardiomyopathy. In particular, the method is useful for determining an individual's genetic information, and diagnosing e.g. Gaucher's disease, haemophilia, buchenne's muscular dystrophy, sickle cell anaemia, Tay-sacks disease, phenylketonuria or cystic fibrosis. The present sequence is a PCR primer used to amplify a region of the beta cardiac myosin heavy chain cDNA containing an FHC-associated mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy (familial or sporadic, FHC, SHC) for facilitating the diagnosis of hypertrophic cardiomyopathy, comprising amplifying beta-cardiac myosin heavy-chain DNA forming an associated with hypertrophic cardiomyopathy in the amplified product, thus, facilitating the diagnosis of hypertrophic cardiomyopathy also included are a set of DNA oligonucleotide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting mutations associated with hypertrophic cardiomyopathy to diagnose hypertrophic cardiomyopathy, comprises amplifying beta-cardiac myosin heavy-chain DNA and detecting the mutation in the amplified product.
                                                                                                                                                                                                                                                                                         Gaps

The present sequence is a PCR primer for a PDZ domain. PDZ domains of proteins are named after three prototypical proteins: PSD95, Drosophila large disc protein and Zonula Occludin 1 protein. PDZ domain proteins are involved in synapse formation by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New inhibitors of binding of a PDZ protein and PL protein for inhibiting T cell-mediated response by hematopoietic cells, or for treating diseases characterized by inflammatory and humoral immune responses, e.g.

The present invention relates to a method for modulating a biological function of an endothelial cell or haematopoietic cell, comprises introducing into a cell an antagonist that inhibits binding between a PDZ domain protein to result in inhibition of a PDZ domain protein to result in inhibition of a PDZ domains of proteins are named after three prototypical proteins. PBD5 Jonains are involved in synapse formation 1 proteins are involved in synapse formation by creating transmembrane neurotransmitter receptors through intracellular interactions. The inhibitors identified by the present invention can be used to treat a disease mediated by the present invention can be used to treat a disease mediated by the present invention can be used to treat a disease mediated by the present invention can be used to treat a disease mediated by the present invention can be used to treat a disease mediated by the present invention can be used to treat a disease mediated by the present invention can be used to treat a disease mediated by the present invention can be used a transplant diseases (e.g. viral infection), ischaemia, vasulitis and crohn's disease. The inhibitors can also be used to prevent transplant transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hematopoietic cell; PDZ; PL; autoimmune disease; inflammation; allergy; asthma; multiple sclerosis; cancer; infection; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                            function of an endothelial cell or hematopoietic cell. The method between a bpz protein and a PLO protein. The inhibits binding between a PDZ protein and a PLO protein. The inhibitor is used to treat a disease mediated by hematopoietic cells, e.g. autoimmune disease. It may also be used to prevent transplantation rejection of a solid organ allergy, inflammatory bowel diseases, ulcerative colitis, ileitis, psoriasis, asthma, atopic dermatitis, autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, insulin-dependent diabetes, Hashimoto thyroiditis, osteoarthritis, graft rejection, transplantation rejection, tatherosclerosis, cancers, infectious diseases, ischemia, vesulitis and Crohn's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to methods and reagents for determining the apparent affinity (Kd) of binding between a PDZ domain and a ligand. The invention also relates to methods and reagents for determining the Ki of an inhibitor of binding between a PDZ domain and a ligand, identifying an agent that enhances binding of a PDZ domain and a ligand, and determining the potency (K-enhancer) of binding between a PDZ domain and a ligand, by
cell, useful for treating autoimmune diseases and infectious diseases, by administering an antagonist that inhibits binding between a PDZ protein
                                                                                                                  invention relates to a new method for modulating a biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Assays for determining the affinity of binding between a PDZ domain and a ligand, and determining the Ki of an inhibitor of the binding, comprises using a polypeptide comprising a PDZ domain and a non-PDZ domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Immunosuppressive; antiinflammatory; affinity; Kd; binding; PDZ domain;

              PDZ domain and a non-PDZ domain on a surface. The modulator (preferably, an inhibitor) of interaction between PDZ and PL is useful for treating a disease characterised by leukocyte activation, e.g., an autoimmune disease that is characterised by inflammatory or humoral immune response, and for reducing inflammation in a subject. This sequence represents a PDZ domain protein related PCR primer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method (M1) for modulating a biological function of an endothelial cell or haematopoietic cell. M1 comprises introducing into the cell, an agent that inhibite binding of a PDZ (PSD95, Drosophila large disc protein, and Zonula Occludin 1 protein) protein and a PDZ ligard (PL) protein in the cell, and so modulates the
determining the ligand bound with an immobilised polypeptide comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hematopoletic cell e.g., a T-cell or B-cell comprises introducing into the cell, an agent that inhibits binding of a PDZ protein and a PDZ ligand protein in the cell.
                                                                                                                                                                                                                                    Gaps

In vivo mutagenesis enabling site-specific mutations, deletions and insertions with integrative oligonuclectides, useful as diagnostic tools where biological consequences are assessed in the creation of strains or

Disclosure; SEQ ID NO 79; 96pp; English.

The invention relates to a novel method for in vivo site-directed mutagenesis which involves introducing a mutation into a target double-stranded nucleic acid sequence having a first and second strand in a cell. The method comprises introducing a double-stranded nucleic acid cassette into a target nucleic acid sequence at an insertion point,

transforming the cell with a first oligonuclectide, and selecting for employs using integrative recombinant oligonuclectides (IRDS). The cassette is an Reporter (RE)-cassette and contains a first portion homologous to a nucleic acid sequence on a first side of the insertion homologous to a second nucleic acid sequence on a second side of the insertion point, and a nucleic acid sequence on a second side of the insertion point, and a nucleic acid sequence encoding a reporter located between the first portion and the second portion. The first oligonucleotide comprises a nucleic acid sequence concern the chosen strand) of the target nucleic acid sequence of the insertion on the first side of the insertion point, and a nucleic acid sequence the chosen strand of the target nucleic acid sequence of position on the second side of the insertion point, and sequence at a position on the second side of the insertion point, and comprising at least one nucleotide that differs from the chosen strand of the target nucleic acid sequence cencoding the reporter gene indicates integration of the oligonucleotide sequence comprising at least one nucleotide that differs from the carget conding the reporter gene indicates integration of the oligonucleotide sequence comprising at least one nucleotide that differs from the carget conding the cassetter at a different position within a gene, such that consequences assessed. The methods and compositions are useful as consequences assessed. They can also be used in targeted changes in the consequences assessed. They can also be used in targeted changes in the variant used in the consequence of various organisms, modification of large human genes and larger variant used in the number of various organisms, modification of large human genes and larger variances of site-directed mutagenesis. This polymucleotide represents a variance of various organisms, publication of large human genes and larger variances as the consequence on a larger consequence. ö Gaps ö 63.3%; Score 15.2; DB 10; Length 24; 85.0%; Pred. New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 105576; 9pp; English.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its

perfect match, perfect mismatch, antisense match or antisense mismatch.
Also disclosed is a method of gene expression analysis. The array is used
in monitoring gene expression levels by hybridisation to a DNA library,
in analysis of genetic variation or in hybridisation of tag-labelled
compounds. The nucleic acid probes are specifically designed for analysis
of at least one target sequence. The method of analysis comprises
compounds are attached to a solid support. The analysis comprises monitoring
compounds are attached to a solid support. The analysis comprises monitoring
gene expression levels, identifying biallelic markers or polymorphisms,
cor family members of a gene and a cross species comparison. Each of the
mucleic acids further comprises a tag sequence. The array of nucleic acid
probes is useful in in situ hybridisation, in Southern, Northern or dotcorrect and subclones containing sequence or specific
mutations of any gene, in mapping the 5' termini of mRNA molecules by
primer extensions or in screening CDNA or genomic libraries or subclones
for additional subclones containing segments of DNA that have been
conclained and previously sequenced. The sequence presented is one of the
nucleic acid probes incorporated in the microarray. Note: The sequence
data for this patent can also be obtained in electronic format directly
from USPTO at sequence.html

       PCR primers (AAT35179-85) were used to amplify cDNA coding for fragments of human mature recombinant alpha-foetoprotein (AFP). Plasmid pI18, which contains the coding region of AFP (see also AAT3513), was used as template. Primer DomII3 (AAT35182) was used with primer DomII5 (AAT35181) to amplify AFP domain II (AAR99224) cDNA, and with primer DomI25 (AAT35179) to amplify domain I+II (AAR99222) cDNA. The recombinant AFP

25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid above method is useful for detecting a target nucleic acid, which (I) The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Array comprising adapter sequences useful for immobilizing or detecting a target nucleic acid sequence, has different addresses comprising different specific capture probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an oligonucleotide array (I) comprising at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       / Match 60.8%; Score 14.6; DB 6; Length 24; Local Similarity 81.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                 The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an oligonucleotide array (1) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (1) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid,
                                           Array comprising adapter sequences useful for immobilizing or detecting a target nucleic acid sequence, has different addresses comprising different specific capture probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Array comprising adapter sequences useful for immobilizing or detecting a target nucleic acid sequence, has different addresses comprising

This invention describes the identification of transcription factor responsive elements and/or target genes and/or cofactors of transcription factors. The method comprises: (a) introducing a gene trap vector into a eukaryotic cell in culture, where the vector contains a reporter gene, a polyadenylation sequence and a selectable marker gene; (b) selecting cells containing the vector; (c) contacting the cells with a transcription factor; (d) identifying and culturing cells that exhibit a change in reporter gene activity; and (e) identifying the target genes and/or cofactors of the transcription factors and/or the transcription factor responsive elements. The gene trap technique has been used to show that the Engrailed homeodomain (EnHD) has target sequences within an internal promoter/enhance of the bulllous pemphigoid antigen (BPAG1) gene locus of embryonic stem cells. This sequence represents a PCR primer used
                                                                        Transcription factor responsive element, cofactor, embryonic stem cell; gene trap vector, engrailed homeodomain; EnHD; BPAG1; target gene; En-2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identification of transcription factor targets - using gene trap vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tuberculosis, TB; immunisation; immune response; MPT 63 gene; DNA vaccine; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               $
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening the 5' termini of mRNA molecules by primer extensions or in screening segments of BNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acids to at least two or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inczymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents one of the HBV ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences disclosed in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
                                                                                                                                                                                                                                                                                                       Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis B virus; HBV; ss; enzymatic nucleic acid; RNA cleavage; hepatitis B virus infection; hepatitis; hepatocellular carcinoma; cirrhosis; liver failure; lamivudine; interferon; genetic drift; virucide; hepatotropic; antiinflammatory; oytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  60.0%; Score 14.4; DB 8; Length 31; 75.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a PCR primer for the Mycobacterium tuberculosis MPT 63 gene. Once amplified, the gene can be used in DNA vaccines to elicit an immune response in humans, thus enabling immunisation against the bacterium. This gives protection from tuberculosis (TB) either by DNA vaccine alone or by combining the vaccine with the present BCG version to give an enhanced immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus, HBV; RNA stability, RNA expression, RNA synthesis, antisense, enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule, aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic;

The specification describes termamyl-like alpha-amylase variants that have altered amino acid sequences to improve properties. The variants are produced by creating one or more of the following mutations in amino acid sequence of the parent termamyl-like alpha-amylase: T141, K142, F143, D144, F145, P146, G147, R148, G149, Q174, R181, G182, D183, G184, K185, R11, Q172, F145, N195, H107, K108, G109, D166, W167, D168, G169, S170, R11, G172, K269, K269, W270, D211, L272, G273, A274, L275, K311, E346, K385, G456, N457, K458, P459, G460, T461, V462, T463. The used in the production of sweeteness and ethanol from starch, and/or for textile desizing, and in starch liquefaction and/or saccharification processes. The present PCR primer was used to construct the variants of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gene enhancer 84-57.31; embryotic development deformity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes mouse polycomb gene enhancer 84-57.31 (1). Also described is a process for preparing (1) using DNA recombination techniques. (1) can be used for treating several diseases e.g. embryotic development deformity and tumours. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polynucleotide encoding it, useful for treating several diseases e.g. embryotic development deformity and tumors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprishing one or more binding arms, without requiring the presence of a 2'-OH group within the molecule for activity. The nucleic acids are useful for treating hepatitis b virus infection, hepatitis, hepaticis or combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an enzymatic nucleic acid molecule which cleaves HBV RNA in the invention. Note: The sequence data for this patent is also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Termamy1-like; alpha-amylase; variant; washing; dishwashing; production; sweetener; ethanol; starch; textile desizing; starch liquefaction;
                                                                                                                                                                                                                                                                                       Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mutagenic primer DA23 used to amplify termamy1-like alpha-amylase DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel polypeptide-human motor protein analogous protein 10.12, the polymucleotide encoding this polypeptide and a method for producing this polypeptide by using recombinant DNA technology. The invention also discloses the method for curing several diseases, such as protein metabolism disturbance related disease, membrane protein in dysfunction related disease and call withering dysfunction related disease and call withering an antagonist for resisting this polypeptide and its therapeutic action, and the application of the polymucleotide encoding this novel human motor protein analogous protein 10.12. The present sequence is a PCR primer used to clone the cDNA encoding human motor protein analogous protein

```
The invention discloses a human starchy precursor bindin 10.78 polypeptide. Also disclosed are the polynuclectide for coding it, the process for preparing the polypeptide by DNA recombination, the application of the polypeptide in treating diseases (e.g. cancer, HIV infection), the antagonist of the polypeptide and its medical action, and the application of the polynucleotide. The sequence presented is the PCR primer, #2, which was used to amplify human starchy precursor bindin 10.78 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polypeptide-human starchy precursor bindin 10.78 and polynucleotide for coding it.

                                                                                                                                                                                                                                                                                  The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence in the method of analysis comprises in hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acid subscions or in strumbing the 5' termin of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of pNA that have been incleic acid probes incorporated in the microarray. Note: The sequence of the form titer or an also be obtained in electronic format directly from the microarray. Note: The sequence of the form o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ·

                                                                                                                                                                                                                                                                                                                                                                                                                        A-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a transgenic rodent comprising an endogenous gene cluster encoding a metated voltage-gated potassium channel Kvbeta1.1 subunit is a knock-in subunit of an A-type potassium channel. Kvbeta1.1 subunit is a knock-in subunit which is unable to confer N-type inactivation of the channel but retains the ability to co-associate with Kv1 family of alpha-subunits. The invention is useful as a model for psychiatric and neurological disorders to identify anxiolytic compounds and pro-cognitive functions. The invention is useful as a model for evaluating the efficacy of test compounds that modulate Kvbeta1.1 activity. The invention also is useful as a positive anxiolytic control. The present sequence is a PCR primer used in PCR analysis as internal positive control
                                                                                                                                                                                                                                                                                                                                                                                                                Novel transgenic rodent comprising knock-in Kv beta 1.1 subunit of A-t
potassium channel, which is unable to confer N-type inactivation of
channel but retains ability to co-associate with Kv1 family of alpha-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                     This invention describes the construction of libraries of antibody variable domains containing modified complementarity determining regions (CDRs) carrying a cysteine nose and which have cytokine agonist and antagonist mechanisms of action. The method of the invention can be used to obtain peptide ligand mimetics capable of binding a target antigen. The binding members may also be used to provide agonists or antagonists of targets such as cytokines. In particular specific binding members for MTP-1 alpha receptors are useful for treatment of HTV infection and for in vitro investigation of mechanisms of HTV infection. A selection of peptide ligand mimetics from CDR3 cysteine noose libraries provide a means to select a different and potentially more effective population of peptide ligands than direct display of similar cysteine noose ligands on the surface of bacteriophage. The products of the invention have anti-HTV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes a method for enhancing cellular proliferation. The method comprises introducing into a cell a compound that alters the expression or activity of a Histone Nuclear Factor P (HiNF-P) polypeptide to enhance proliferation of the cell. The method of the invention is useful for the diagnosis, prevention and treatment of diseases or conditions associated with aberrant expression or activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modulating cellular proliferation using a Histone Nuclear Factor P (HiNF-P) or Nuclear Protein or Ataxia-Telangiectasia locus (NPAT) polypeptide, useful for diagnosing or treating cancer, immune disorders and/or viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cellular proliferation; histone nuclear factor P; HiNR-P; bone disorder; cancer; immune disorder; cardiovascular disorder; viral infection; PCR; primer; ss.

the HiNF-P polypeptide, such as bone disorders, cancer, immune disorders, cardiovascular disorders and viral infections. PCR primers ADO43696-ADO43697 were used to isolate cDNA encoding HiNF-P.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polypeptide-human zinc finger protein 11.88 and encoding polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to the isolation of human zinc finger protein 11.88, and the polymucleotide sequence encoding it. Also described is the process for preparing the protein by DNA recombination and the application of the polypeptide and polymucleotide in treating various diseases such as cancer and human immunodeficiency virus (HIV) infection. The present sequence represents a PCR primer used to clone cDNA encoding human zinc finger protein 11.88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

PCR primers 819-31 (AAT34297) and 819-28 (AAT34298) were used to amplify a portion of HEK4 binding protein cDNA (see also AAT34292) coding for amino acids 1-179 of the protein (see also AAW0035). The PCR fragment was cloned into vector PCFM1656 and truncated HEK4 binding protein was expressed in Escherichia coli FM5 (ATCC 53911) transformants. The protein was used as an antigen in rabbits. The antisera recognised HEK4 binding
                                                                                                                                                                                                                                                                         Ligand for EPH-like receptors, partic. the HEK4 receptor - useful to modulate growth and differentiation of, e.g. liver and kidney cells, and to treat cancer and nervous system disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human ABC1 cholesterol transporter; chromosome 9q31; ATP-binding casette; HDL deficiency discorder; high density lipoprotein; Tangier disease; TD; familial HDL deficiency; FHA; polymorphism; cardiovascular disease; coronary artery disease; coronary restenosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cerebrovascular disease; peripheral vascular disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This oligonuclectide represents primer 8/97.31 that was used in the PCR amplification of the feline CD70 (B7-2) (see AAZ34838) cDNA. The amplified gene was used in the construction of homology vector 1015.18.8A (LP1-CD86/IRES-CD80), which was used to create recombinant raccompox viruses (RPV) expressing feline CD80 and CD86. The invention relates to a recombinant virus, e.g. RPV, that contains at least one foreign nucleic acid, inserted into a nonessential genomic region, that encodes feline CD80, CD80, CD86 or CTLA-4 protein (see AAY32283-87), or their immunogenic fragments, and is expressed when the recombinant virus is introduced into a sultable host. The recombinant virus may further comprise a foreign nucleic acid encoding an immunogen derived from a feline pathogen. It is used to modulate an immunogen in a feline, particularly as a vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HBK4 binding protein; HBK4 receptor; BPH-like receptor; protein tyrosine kinase; ligand; growth; differentiation; cancer; nervous system disorder; therapy; polymerase chain reaction; PCR; primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the human ABC1 cholesterol transporter protein a member of the APP-binding cassette (ABC transporter) superfamily of a member of the APP-binding cassette (ABC transporter) superfamily of proteins, and plays a crucial role in cholesterol transport, particularly croteins, and plays a crucial role in cholesterol transport, particularly intracellular cholesterol trafficking in monocytes and fibroblasts, being involved in cholesterol efflux from the cell. The gene are associated involved in cholesterol efflux from the cell. The gene are associated involved in cholesterol efflux from the cell. The gene are associated involved in cholesterol efflux from the cell. The gene are associated involved in cholesterol efflux from the cell. The gene are associated another the from the cell. The gene are associated involved in the blod correlate with a high risk of cardiovascular frangier disease (TD) and familial HDL deficiency (FHA). These diseases of Genese, particularly corromary attention provides genetic offers and conversely, a high level of HDL has protective effects against cardiovascular disease. The invention provides genetic constructs and cranspensic cells and non-human animals comprising human ABC1 mucleic cardiovascular disease. Comprising the administration of an expression cardiovascular disease compounds which minic ABC1 extrement or prevention also cardiovascular disease compounds which minic ABC1 extrement of cardiovascular disease compounds which minic ABC1 extrement of disease associated corresponds which minic ABC1 gene to create the cardiovascular disease, especially coronary artery disease, coronary restencings or peripheral vascular disease. They may also be used in the treatment of disease associated cardiovascular disease, coronary restencings or peripheral vascular disease. Huntington's disease, X-linked adrenoleukodystrophy and cardiovascular disease. ```
Treating a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, by administering a compound that modulates LXR- or RXR-mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LXR- or RXR-mediated transcriptional activity or ABC1 expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New array of nucleic acid probes, useful for in situ hybridization, in

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific companiestion to identify of detect the sequence or specific companiestion of any gene, in mapping the 5' termini of mRNA molecules by primer extensions of any gene, in mapping the 5' termini of mRNA molecules by companies and previously sequenced. The sequence presented is one of the isolated and previously sequenced. The sequence presented is one of the cucleic acid probes incorporated in the microarray. Note: The sequence containing sequence presented is one of the containing the sequence presented is one of the cucleic acid probes incorporated in the microarray. Note: The sequence containing sequence presented is one of the form USPTO at sequence. The sequence than land and sequence or probes incorporated in the microarray. Note: The sequence or probes the sequence or probes incorporated in the microarray.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

The inventor in disturbes a microarray computating a purality or interior acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression nevels. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. Each of the nucleic acid gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotones but hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' terminin of maNA molecules by primer extensions or in screening SONA or genomic libraries or subclones for additional subclones containing segments of DNA that have been considered and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence date from USPPO at sequence than

acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequence.html invention discloses a microarray comprising a plurality of nucleic Sequence 25 BP; 6 A; 7 C; 8 G; 4 T; 0 U; 0 Other;

Interleukin -2/granulocyte-macrophage colony stimulating factor fusion protein.

Claim 5; Page 1; 17pp; Chinese.

The present invention describes an interleukin-2/granulocyte-macrophage colony stimulating factor fusion protein (IL-2/GM-CSF fusion protein).

The fusion protein is produced by genetic engineering technology by subcloning against IL-2 and end reform and a GM-CSF connection IL-2/GM-CSF expression plasmid is constructed. The fusion protein can be used to convert Escherichia coli obtaining high effect expression. The fused protein possesses IL-2 and GM-CSF dual activity. The present sequence represent an oligonucleotide used in the construction of the IL-2/GM-CSF fusion protein 8888888888

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114|gplAF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll X110-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AU103061 Sugano Homo sapiens cDNA library Homo sapiens cDNA clone COLF1890, mRNA sequence.

/note="Organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site 1: BamHi; Site 2: BglII; RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units: For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid AA was grown at UC San Diego in 2002. DNA was extracted from leaf strips, double digested using BamHI and BglII, and ligated to form circular plasmids. DHIOB cells were transformed and then screened on LB plates with ampicillin."
